

# My experience with $\text{\LaTeX}$

Damian Bachasingh

April 21, 2017

# The editor

Texworks is a flexible editor that I have used on the Windows platform. It gives me the opportunity to create more complex document, although creating the first might take some time to get used to.

# The basics

I learned the basics of LaTeX: starting a document, creating a title and author. Later on I was able to create headers, section, using layout styles, numbering the pages and creating a table of contents page.

I now know how to use images in my  $\text{\LaTeX}$  documents. With the help of the pdf packages, I can easily type in "includegraphics" and specify the filename and size.

# References

I have used Bibtex to show references. I am able to cite the sources from a source. Furthermore, I have learned how to simple cite from pages that support bibtex.

# Will I ever use Latex again in the future?

Yes, I do plan on getting more familiar with Latex, because the possibilities with it are amazing. Moreover, using Latex takes a more professional approach for documenting.
